

Pad foundation design

*Geotechnical design*

*Allowable bearing capacity by Brinch Hansen*

$$q_{all} = \frac{1.3cN_c + q'_o N_q R_{w1} + 0.4\gamma B N_\gamma R_{w2}}{\gamma_f}$$

where :

$q'_o$  is the effective over- burden pressure  $q'_o = \gamma D_f$

where :

$\gamma$  is the unit weight of the soil

$D_f$  is depth of the foundation base from the ground level

$B$  is the width of the foundation

$\gamma_f$  is factor of safety against bearing capacity failure (2.0 – 3.0)

$c$  is the cohesion (for the drained or undrained case under consideration) and  $N_c$ ,  $N_q$  and  $N_\gamma$  are shallow bearing capacity factors (*the calculator selects equivalent allowable bearing capacity factors from internal angle of shear in the Table 1*)

$R_{w1}$  and  $R_{w2}$  is factors of water table effect

When the water table is above the base of foundation at a distance ‘a’ the correction  $R_{w1}$  is

$$R_{w1} = 1 - 0.5 \left( \frac{a}{D_f} \right) \leq 1$$

When the water table is below the base of foundation at a distance ‘b’ the correction  $R_{w2}$  is

$$R_{w2} = 0.5 + 0.5 \left( \frac{b}{B} \right) \leq 1$$

*Preliminary sizing of pad footing*

$$Area = V_d / q_{all}$$

$$Area, pad footing = b * l$$

where :

$V_d$  is design vertical load,  $V_d = dead load + 1.3 * live load$  ;

$q_{all}$  allowable bearing capacity

$b$  and  $l$  are the width and length of the foundation

*Ultimate bearing pressure*

$$ULS, q = factored load / Area$$

Where:

factored load is dead load \* safety factor + live load \* safety factor

Area is the pad foundation area

*Flexure design*

*Design load*

$$\text{Design load} = \text{Live load} * SF, q_k + \text{Dead load} * SF, g_k$$

where :

SF, q<sub>k</sub> and SF, g<sub>k</sub> are safety factors for live load and dead load respectively

*Design moment at the face of the column*

$$M_{ED1} = \frac{ULS, q \cdot l \left[ \frac{b - c_x}{2} \right]^2}{2}$$

$$M_{ED2} = \frac{ULS, q \cdot b \left[ \frac{l - c_y}{2} \right]^2}{2}$$

where :

ULS, q is ultimate bearing pressure

b and l are the width and length of the foundation

c<sub>x</sub> and c<sub>y</sub> is column cross sectional dimension

*Determine K for respective M<sub>ED</sub>*

$$K_1 = M_{ED1} / (l * d_1^2 f_{ck})$$

$$K_2 = M_{ED2} / (b * d_2^2 f_{ck})$$

where :

M<sub>ED1</sub>, M<sub>ED2</sub> are bending moment at the face of the column

b and l are the width and length of the foundation

d<sub>1</sub> and d<sub>2</sub> the effective depths in orthogonal directions

$$d_1 = h - \text{cover} - \emptyset_1 / 2$$

$$d_2 = h - \text{cover} - \emptyset_1 - \emptyset_2 / 2$$

where :

h is depth of the pad foundation

∅ is diameter of the reinforcement bar

f<sub>ck</sub> is characteristic compressive strength

$$K' = 0.6 \delta - 0.18 \delta^2 - 0.21 = 0.16955$$

(δ=1.0 means no redistribution and δ = 0.85 means 15% moment redistribution).

If  $K \leq K'$ , no compression steel needed. If  $K \geq K'$ , compression reinforcement required – not recommended for typical foundation, thus redesign the section of the foundation.

*Lever arm (z)*

$$z_1 = \frac{d_1}{2} (1 + \sqrt{1 - 3.53K_1}) \leq 0.95d_1$$

$$z_2 = \frac{d_2}{2} [1 + \sqrt{1 - 3.53K_2}] \leq 0.95d_2$$

where :

$d_1$  and  $d_2$  are effective depth in orthogonal directions

*Area of tensile reinforcement ( $A_s$ )*

$$A_{s,1} = \frac{M_{ED}}{f_{yd} * z_1}$$

$$A_{s,2} = \frac{M_{ED2}}{f_{yd} * z_2}$$

where :

$M_{ED1}$ ,  $M_{ED2}$  are bending moment at the face of the column

$z_1$  and  $z_2$  are lever arms in orthogonal directions

$f_{yd}$  is design yield strength of steel =  $f_{yk} / \gamma_s$

where :

$f_{yk}$  is characteristic yield strength of steel

$\gamma_s$  partial safety factor for steel

*Number of reinforcement bars*

$$n_1 = \frac{A_{s,1}}{a_s}$$

$$n_2 = \frac{A_{s,2}}{a_s}$$

where :

$A_{s,1}$  and  $A_{s,2}$  are areas of the tensile reinforcement

$a_s$  is area of a single reinforcement bar

*Spacings (s)*

$$s_1 = \frac{l}{\left(\frac{A_{s,1}}{a_s} - 1\right)} \leq s_{limit}$$

$$s_2 = \frac{b}{\left(\frac{A_{s,2}}{a_s} - 1\right)} \leq s_{limit}$$

where :

$A_{s,1}$  and  $A_{s,2}$  are areas of the tensile reinforcement

$a_s$  is area of a single reinforcement bar

$b$  and  $l$  are the width and length of the foundation

$S_{\text{limit}}$  is the maximum spacing  $\{2h, 250\}$

where :

$h$  is the foundation depth

*Minimum reinforcement requirements*

$$A_{s-1,min} \geq \frac{0.26 f_{ctm} l d_1}{f_{yk}} \geq 0.0013 l d_1$$

$$A_{s-2,min} \geq \frac{0.26 f_{ctm} b_t d_2}{f_{yk}} \geq 0.0013 b_t d_2$$

where  $f_{ck} \geq 25$

where :

$f_{ctm}$  is tensile strength of the concrete

$$f_{ctm} = 0.3 f_{ck}^{2/3} \text{ for concrete class } \leq C50/C60$$

$f_{yk}$  is characteristic yield strength of steel

$b_t$  and  $l$  are breadth and length of the tension zone

$d_1$  and  $d_2$  are effective depth in orthogonal directions

*Maximum reinforcement requirement*

$$A_{s,max} \leq 0.04 A_c$$

where:

$A_c$  is area of concrete

$$A_c = b * h \text{ and } l * h$$

*Check minimum spacing between bars*

$$\text{Spacing} > \phi_{bar} > 20 > A_{gg} + 5 \text{ (mm)}$$

where :

$A_{gg}$  is size of the coarse aggregate

Table 1 Bearing capacity factors for a given internal angle of shear

Internal angle of shear $\phi$	Bearing capacity factors*		
	$N_c$	$N_q$	$N_\gamma$
0	5.0	1.0	0.0
5	6.5	1.5	0.0
10	8.5	2.5	0.0
15	11.0	4.0	1.4
20	15.5	6.5	3.5
25	21.0	10.5	8.0
30	30.0	18.5	17.0
35	45.0	34.0	40.0
40	75.0	65.0	98.0

\*Values from charts by Brinch Hansen (1961).

### Shear design

Beam shear (at critical section -  $d$  distance away from column face)

$$V_{ED,1} = ULS, q * \left( \frac{b - c_x - 2d}{2} \right)$$

$$V_{ED,2} = ULS, q * \left( \frac{l - c_y - 2d}{2} \right)$$

where :

ULS,q is ultimate bearing pressure;

$c_x, c_y$  are column width along x and y direction

$d$  is average effective depth,  $d = (d_1 + d_2)/2$

$$d_1 = h - \text{cover} - \phi_1/2$$

$$d_2 = h - \text{cover} - \phi_1 - \phi_2/2$$

where :

$h$  is depth of the pad foundation

$\phi$  is diameter of the reinforcement bar

$$\frac{V_{ED,1}}{d_1}; \text{gives beam shear stress}$$

$$\frac{V_{ED,2}}{d_2}; \text{gives beam shear stress}$$

Design punching shear stress (at face of column)

$$v_{ED,max} = \frac{\beta v_{ED}}{u_0 d}$$

where :

$\beta$  is factor dealing with eccentricity

$v_{ED}$ , is applied force minus net force within the area of the foundation column

$$V_{ED} = \text{Applied load} - \text{ultimate bearing press} * (c_x * c_y)$$

$u_0$  is perimeter of the column cross section

$d$  is average effective depth,  $d = (d_1 + d_2)/2$

*Design punching shear stress (at basic control perimeter,  $u_1$ )*

$$v_{ED} = \beta \frac{V_{ED}}{u_1 d}$$

where :

$\beta$  is factor dealing with eccentricity

$V_{ED}$ , is applied force minus net force within the area of the control perimeter on the foundation

$V_{ED} = \text{Applied load} - \text{ultimate bearing press} [(c_x * c_y) + \pi(2d)^2 + 4d(c_x + c_y)]$

$u_1$  is  $2(c_x + c_y) + 2\pi * 2d$

$d$  is average effective depth,  $d = (d_1 + d_2)/2$

*Determine  $v_{RD,max}$  (refer to table 7:concise table for respective concrete grade)*

$$v_{RD,max} = 0.5v_{fcd}$$

where :

$f_{cd}$  is design compressive strength,  $f_{cd} = f_{ck}/\gamma_c$

$$v = 0.6 (1 - f_{ck}/250) \alpha_{cc}$$

where :

$f_{ck}$  is characteristic compressive strength of the concrete

$\alpha_{cc}$  is the coefficient taking account of long term effects on the compressive strength and of unfavourable effects resulting from the way the load is applied. It is recommended as 1.0

$\gamma_c$  partial safety factor for concrete

If  $V_{ED,max} \leq V_{RD,max}$ , proceed to the next step - otherwise redesign the section. (Increase the compressive strength of the slab)

*Concrete shear capacity (without shear reinforcement) ( $V_{RD,c}$ )*

$$v_{RD,c} = C_{RD,c} k (100\rho f_{ck})^{\frac{1}{3}} \geq V_{min}$$

$$V_{min} = 0.035 k^{1.5} f_{ck}^{0.5}$$

$$\rho_x = \frac{A_{s,1}}{l * d_1} \quad \rho_y = \frac{A_{s,2}}{b * d_2}$$

$$\rho = (\rho_x * \rho_y)^{\frac{1}{2}} \leq 0.02$$

where :

$C_{RD,c}$  is coefficient derived from test (0.18/ 1.5)

$b$  and  $l$  are the width and length of the foundation

$d$  is average effective depth,  $d = (d_1 + d_2)/2$

$k$  is size factor,  $k = 1 + \sqrt{200/d} \leq 2.0$

$\rho$  is steel ratio and  $\rho_x, \rho_y$  are steel ratio along  $x$  and  $y$  direction

$f_{ck}$  is characteristic compressive strength in MPa

If  $v_{ED} \leq v_{RD,c}$ , safe against shear (beam shear and punching shear).

If  $v_{ED} \geq v_{RD,c}$ , Redesign foundation section !

(punching shear reinforcement is not recommended for foundation)

**Table 7**  
Values for  $v_{RD,max}$

$f_{ck}$	$v_{RD,max}$
20	3.68
25	4.50
28	4.97
30	5.28
32	5.58
35	6.02
40	6.72
45	7.38
50	8.00

### Shear checks for pad foundations
